Witness patient events

Differentiating between epileptic and non-epileptic events is one of the biggest challenges of achieving an accurate diagnosis.

Our threefold system captures EEG, ECG, and video recordings simultaneously so your patients' events can be played back for clinical analysis and you can make more confident decisions about their diagnosis and treatment plan.

Customise trace settings to pinpoint abnormalities

At-home monitoring between 3-10 days

Standard epilepsy management often requires hospital-based tests that are either too short for an accurate diagnosis or inaccessible due to months-long waiting lists and limited locations.

Seer Medical offers long-term, at-home monitoring between 3-10 days and has clinics across Australia.

Preliminary testing requirement

A routine EEG is required prior to referring patients for long-term video-EEG-ECG monitoring.

If there are specific clinical factors which make a routine EEG study inappropriate or unnecessary, please provide this detail in your referral.

Reports are reviewed and prepared by our renowned team of neurologists within five (5) weeks of the end of monitoring.

Refer, track, and review on one platform

From referral through to prescribed medication adherence, Seer Cloud gives you a 360° view of each patient.

Refer patients for video-EEG-ECG

Short wait times

On average, Seer Medical has appointments available across Australia more than 10 times sooner than hospital-based video-EEG monitoring services.

Fees

Seer Medical is a mixed billing service. There is an out-of-pocket fee for the services provided. Medicare rebates, bulk-billing, and fee exemptions are available. For more information, please visit www.seermedical.com/fees

The Seer app

The Seer app collects self-reported seizure and medication adherence information from your patients which you can access through your Seer Cloud account.

Locations across Australia

We have clinics across the country – in all major cities and various regional areas.
